

MUSCLES OF THE APPENDICULAR SKELETON

MUSCLES OF THE FRONT LIMB

- A. MUSCLES OF THE SHOULDER
- B. MUSCLES OF THE ARM
- C. MUSCLES OF THE FORE ARM AND DIGITS

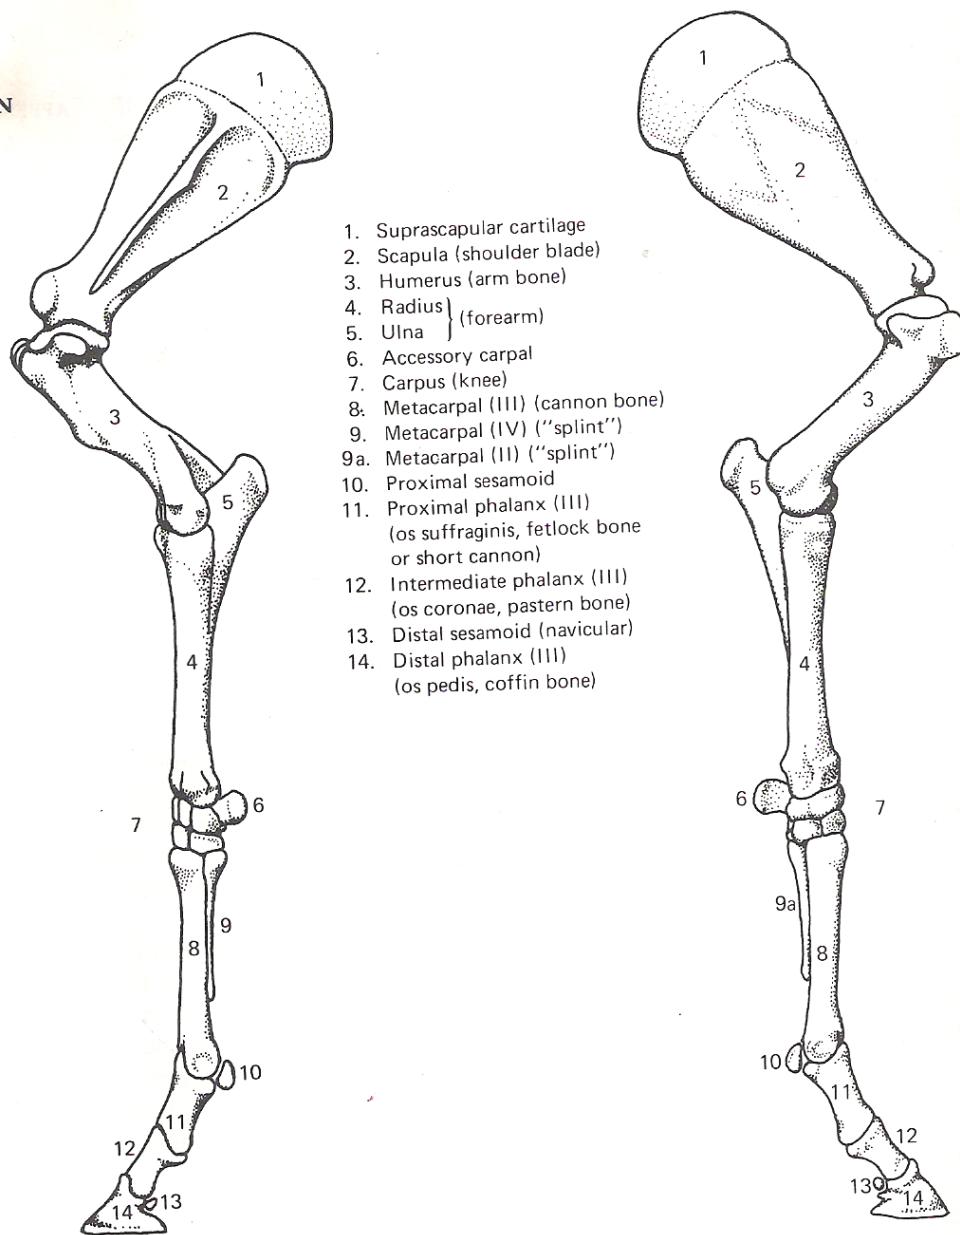

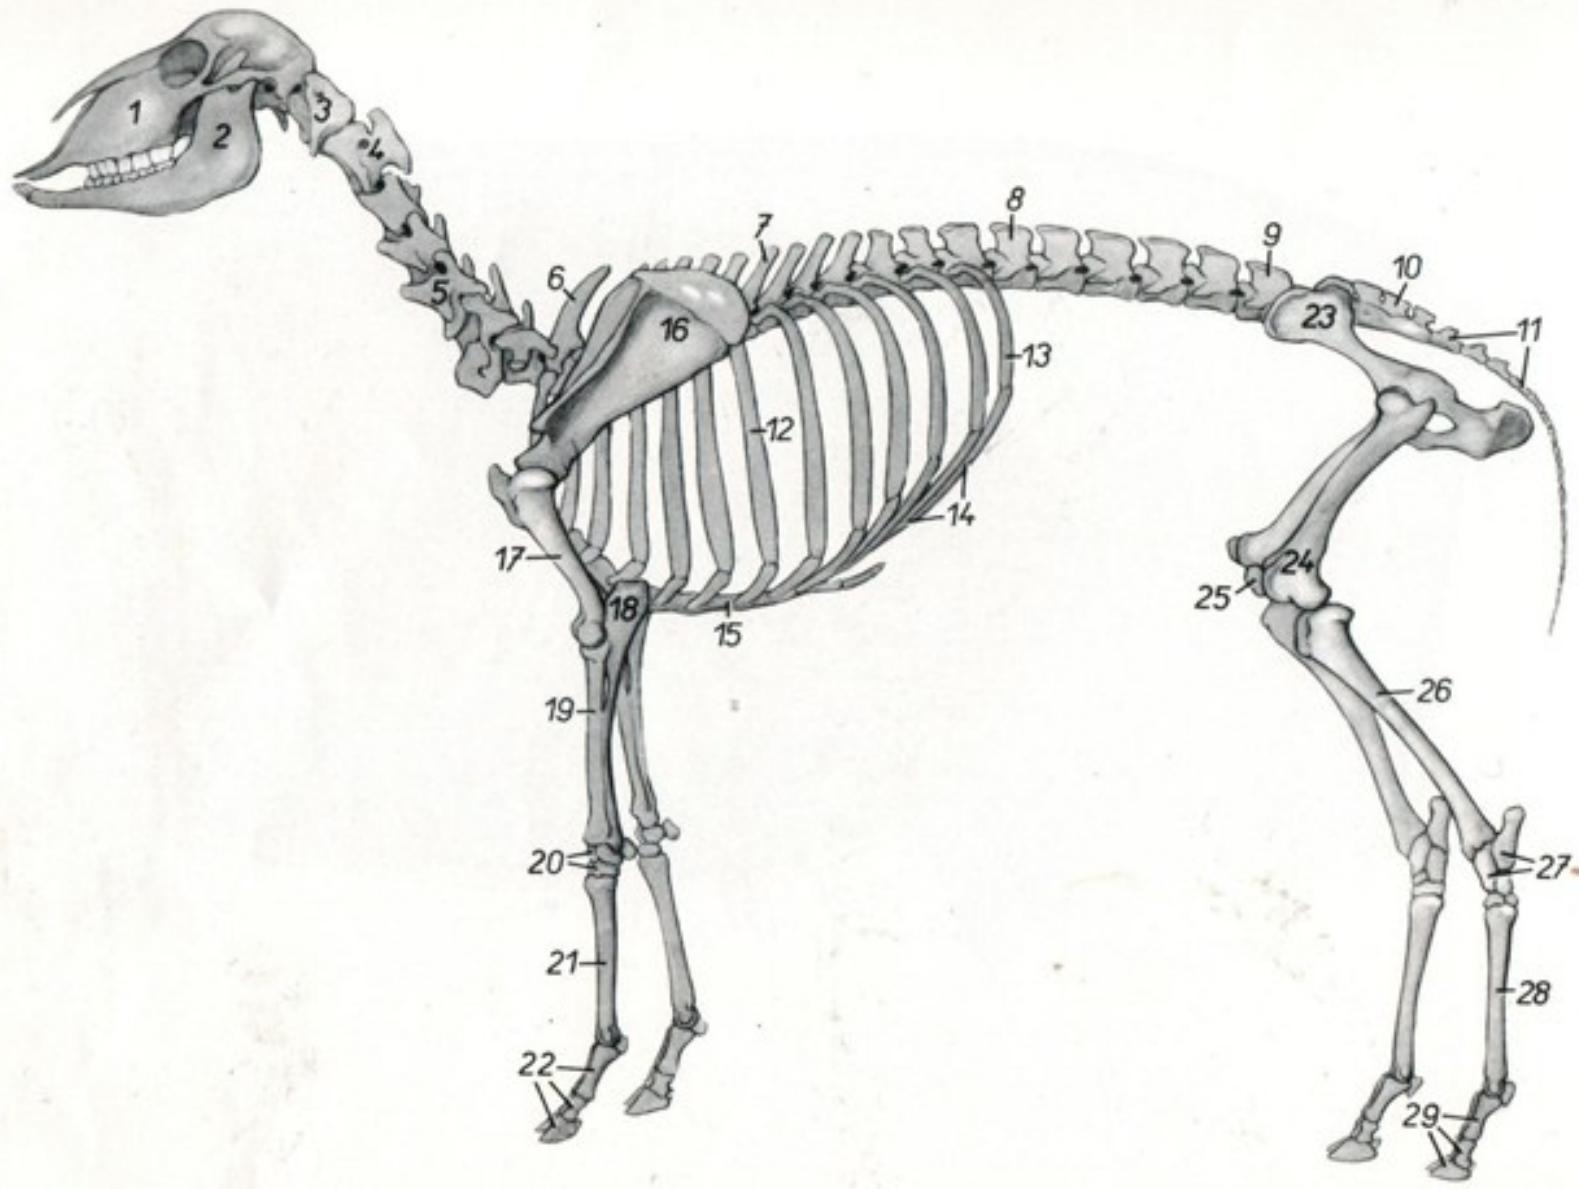

FIGURE 3-2 Bones of the pectoral limb—horse.

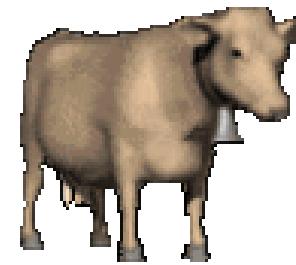

...the bone located on the distal

MUSCLES OF THE SHOULDER

LATERAL GROUP

- DELTOIDEUS
- SUPRASPINATUS
- INFRASPINATUS
- TERES MINOR

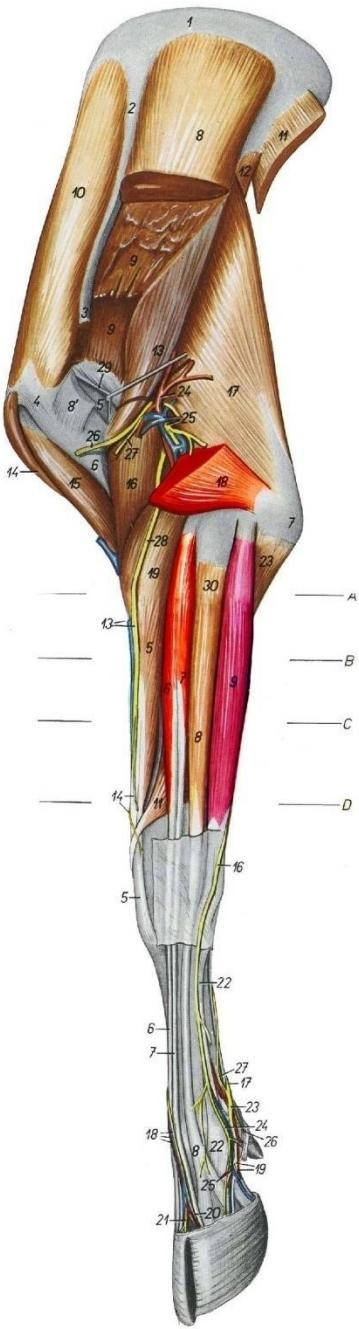

• MEDIAL GROUP

- SUBSCAPULARIS
- TERES MAJOR
- CORACOBRACHIALIS
- CAPSULARIS (Articularis humeri)

MUSCLES OF THE SHOULDER - LATERAL GROUP

Origin: Scapula; Insertion humerus

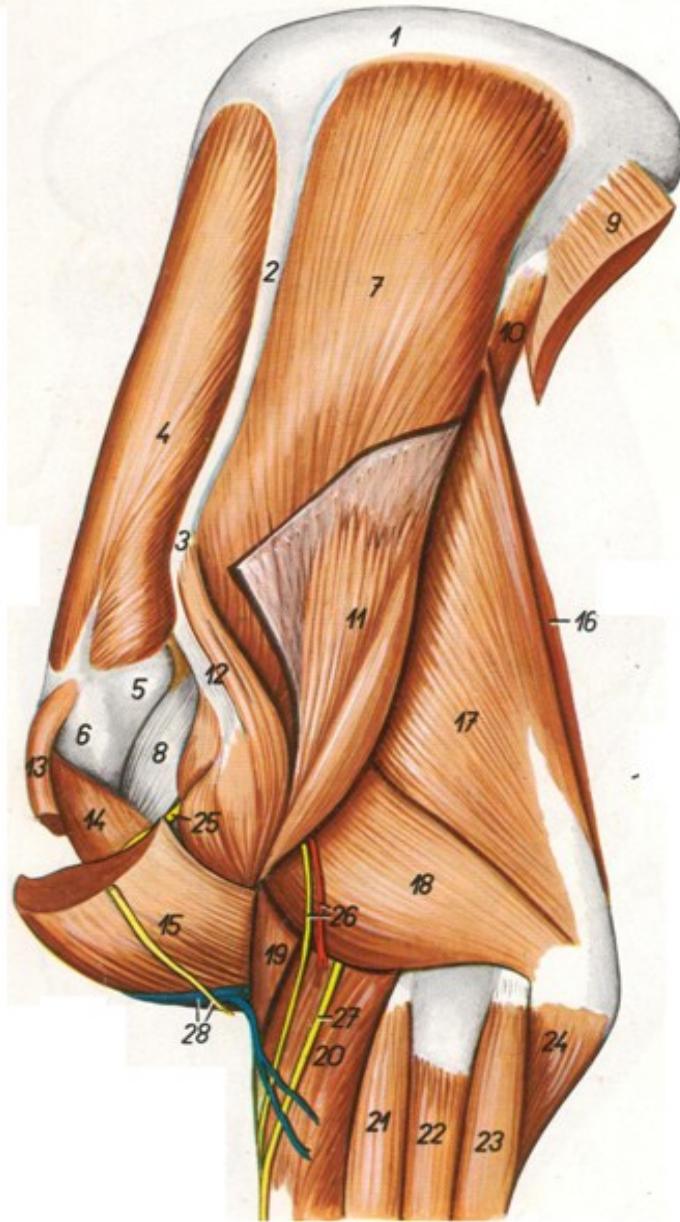

Muscle	Origin	Insertion	Innervation	Action
1. Deltoides m.	Scapula spine Caudal Border of Scapula	Deltoid Tuberosity	Axillary n.	Flexes shoulder
2. Supraspinatus m.	Supraspinaous Fossa Scapular Cartilage and Spine	Greater and Lesser Tubercles of Humerus	Suprascapular n.	Extends shoulder Stabilizes shoulder
3. Infraspinatus m.	Infraspinaous Fossa Scapular Cartilage and Spine	Greater Tubericle of Humerus	Suprascapular n.	Extends <i>and</i> flexes shoulder
4. Teres minor m.	Distal Half of Caudal Border of Scapula	Deltoid Tuberosity of Humerus	Axillary n.	Flexes shoulder

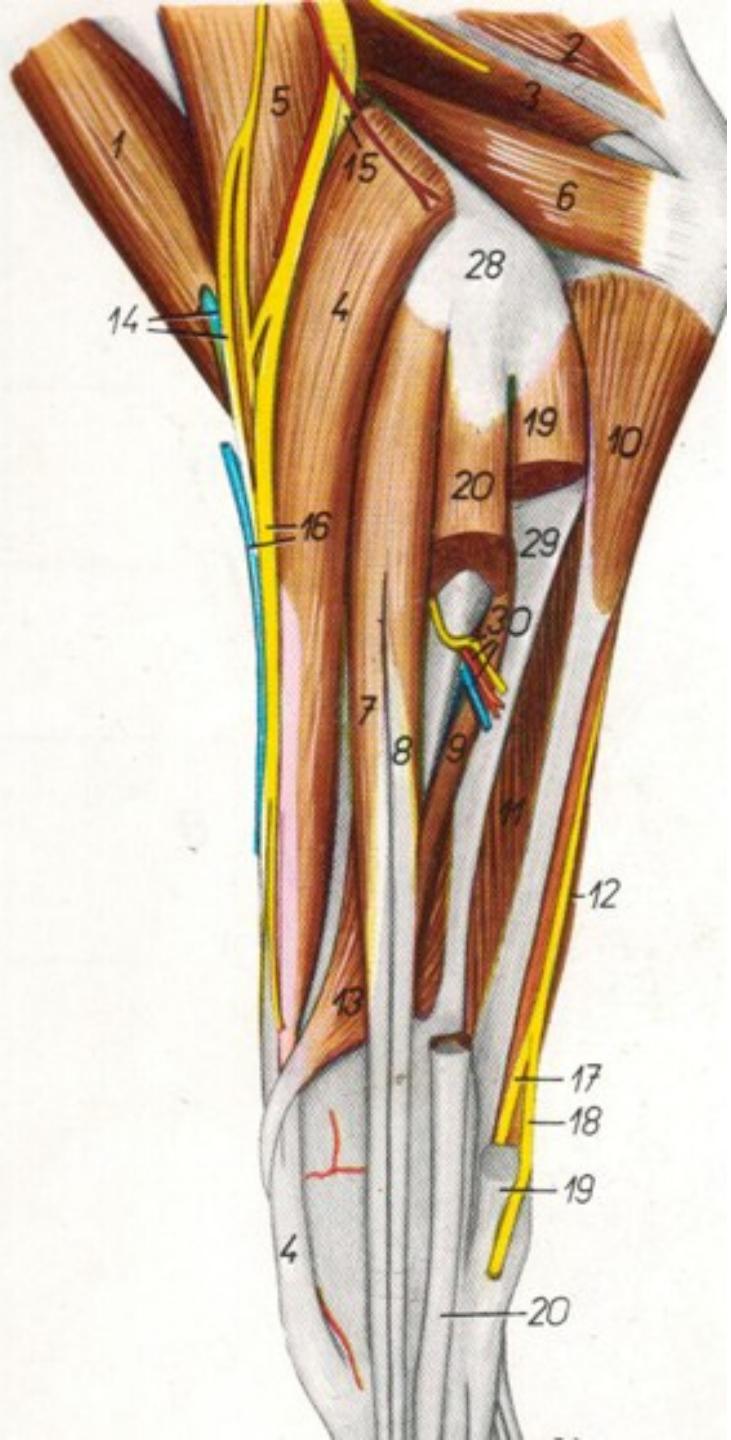

FRONT LEG - HORSE

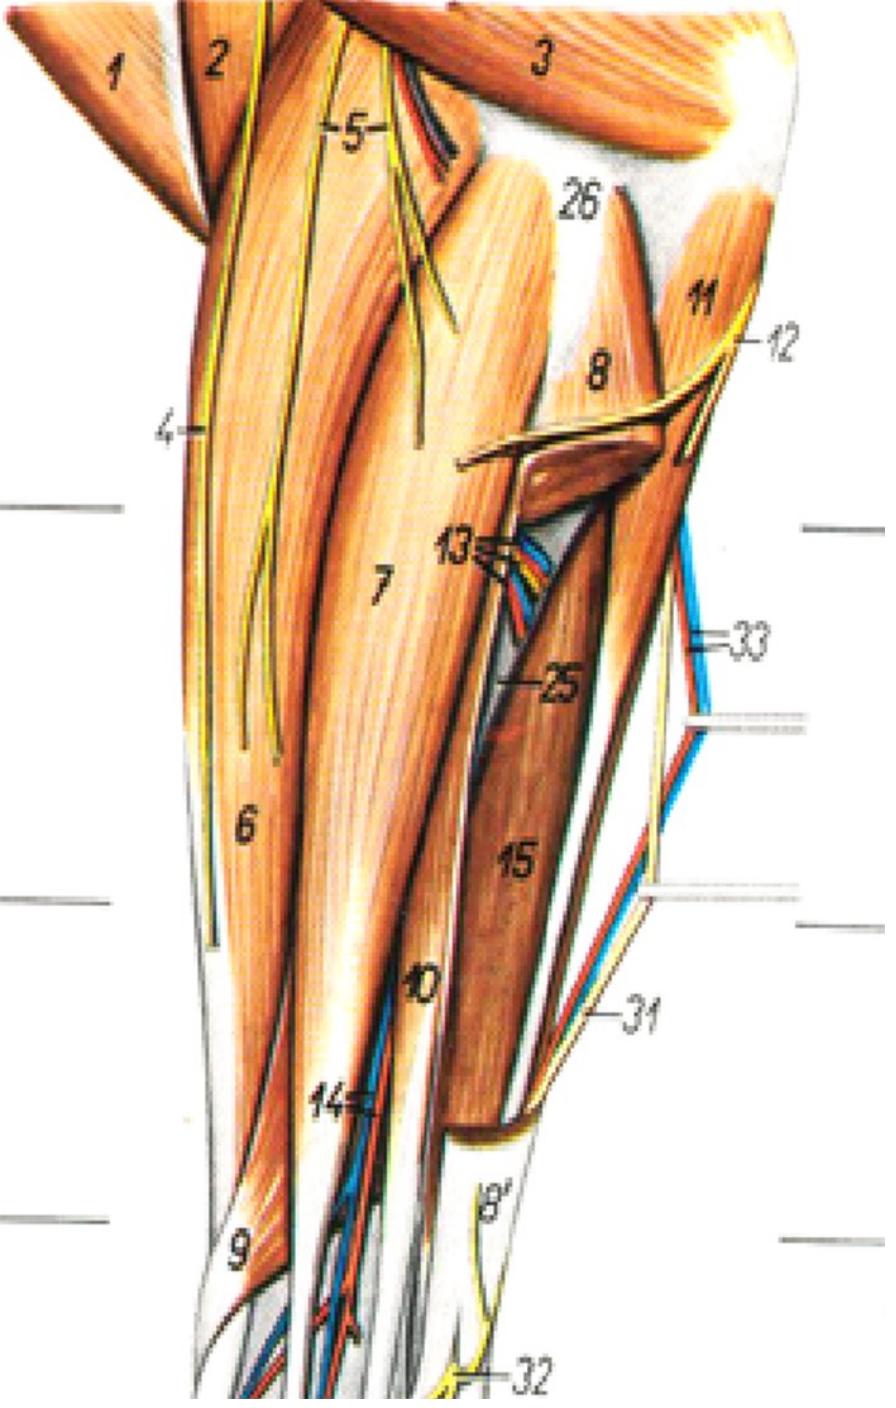

1. Scapular cartilage
2. Scapular spine

Figure 7

NERVES

1. Sternomastoideus
2. Brachiocephalicus
3. Triceps brachii
6. Extensor carpi radialis
7. Common digital extensor
8. Extensor carpi ulnaris
9. Extensor carpi obliquus
10. Lateral digital extensor
11. Flexor carpi ulnaris

MUSCLES OF THE SHOULDER - MEDIAL GROUP

Origin: Scapula; Insertion: humerus

Muscle	Origin	Insertion	Action	
1. Subscapularis m.	Subscapular Fossa; Scapular cartilage	medial Tuberosity of Humerus	Subscapular	Extends shoulder
2. Teres major m.	Caudal Border of Scapula; Subscapularis	Teres Tuberosity of Humerus	Axillary n.	Flexes shoulder
3. Coracobrachialis	Coracoid Process of Scapula	Proximomedial Surface of Humerus	Musculocutane ous n.	Extends shoulder Adducts limb
4. Capsularis	Scapula- Posterior part of glenoid cavity	Posterior surface of shaft of humerus	Axillary nerve	tensing joint capsule

MUSCLES OF THE FOREARM AND DIGITS

I . EXTENSORS -Radial nerve

Muscle	Origin	Insertion	Action
1. Brachioradialis m. 2. (carnivores only)	Lateral condyloid crest (LCC) of humerus	Radius (distal 1/4)	Rotate radius dorsolaterally
2. Extensor Carpi Radialis	-Lateral condyloid crest (LCC) of humerus -Coronoid fossa	Metacarpal II & III	Extend and fix carpus -Flex elbow
3. Common Digital Extensor m.	-Humerus,distal extremity -Radius (proximal extremity) -ulna, lateral surface	Swine-PIII of D2-D5 Ruminants-PIII of D3-D4 Carnivores-PIII of D3-D5 Equidae-PIII of D3	Flexes elbow Extends digit Extend carpus
4. Lateral digital extensor	-Radius, lateral tuberosity -LCL of elbow joint	Cat PIII of D2-D5 Dog: PIII of D3-D5 Ruminants:PIII of D4 Equidae PI of D3	Extend carpus -extend digits
5. Extensor Carpi Obliquus	Radius (lateral dorsal surface)	Swine/equidae-MCII Ruminants-MCIII Carnivores-MCI	-Extends carpus
6. Extensor Carpi Ulnaris (Ulnaris lateralis)	Humerus (lateral epicondyle)	Carnivores-MC5 Swine – MC5 & Ca Ruminants & Equidae _ Ca	Extend carpus Flex carpus

MUSCLES OF THE FORE ARM AND DIGITS

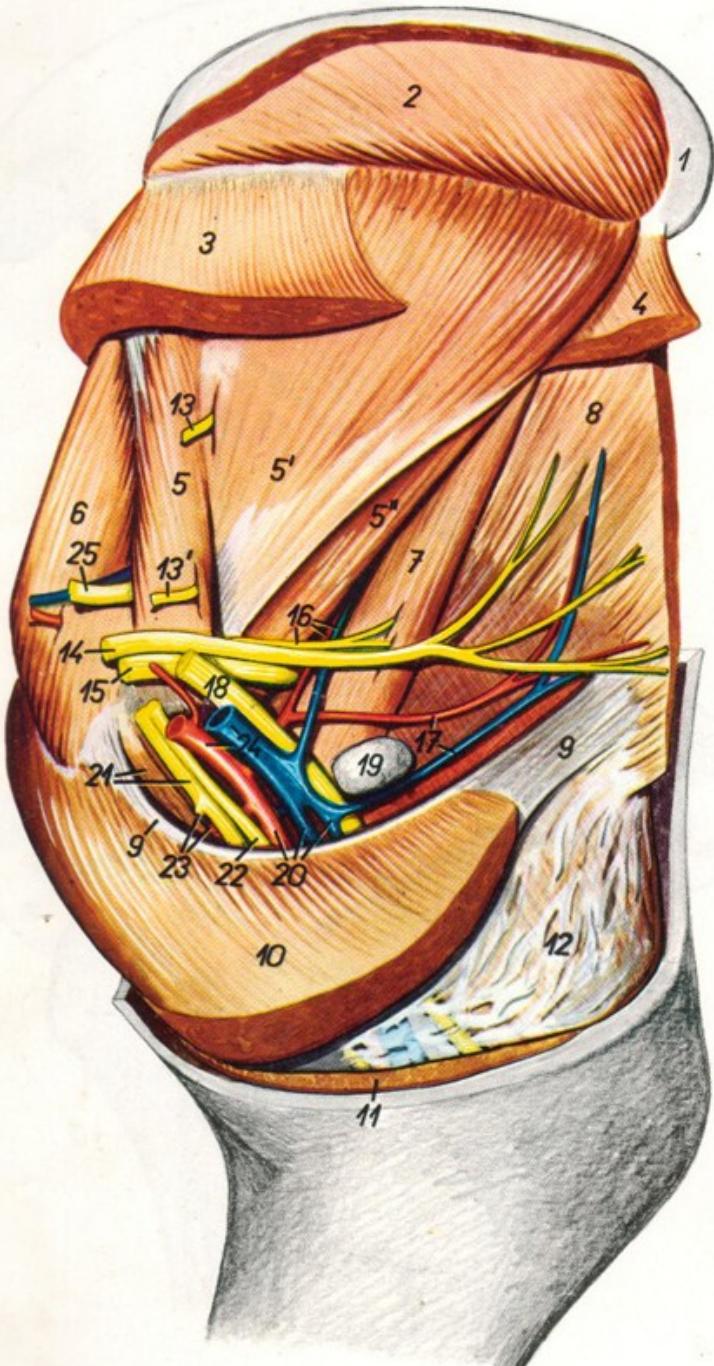

I . FLEXORS –Ulnar nerve /Median nerve

Muscle	Origin	Insertion/NS	Action
1. Flexor carpi ulnaris m. -Humeral head -Ulnar head	Humerus (medial epicondyle) -Olecranon (posteromedial surface)	Ca/ulnar	Flex carpal joint -extend elbow -supination (carnivores)
2. Flexor Carpi Radialis	-Humerus (medial epicondyle)	Median Horse-MC2 Carnivores-MC2 & MC3 Ruminants & pig MC3	Extend elbow -Flex carpal joint
3. Superficial Digital Flexor m.	-Humerus (medial epicondyle)	Median/ulnar Swine & Ruminants-PII D3 & 4 Dog-PII of D2-D5 Cat –PII D1-5 Equidae-PII of D3	Flexes digits Extends elbow Flex carpus
4. Deep digital Flexor -Humeral head -Radial head -Ulnar head	-Humerus (medial epicondyle) Radius (middle part) Olecranon	Median/ulnar Swine –P III D2-5 Ruminants-PIII D3 & 4 Dog-PIII of D1-D5 Cat –PIII D1-5 Equidae-PII Iof D3	Flexes digits Extends elbow Flex carpus
5. Interosseous muscles	MC (proximal ends)	Median/ulnar Sessamoid bones (D1)	-flex D1
6. Short digital flexors)			

THE BRACHIAL PLEXUS

As you reflect skin from the antebrachium, identify carpal (1), metacarpal (2), and digital (not shown) pads. Reflect skin from at least one digit (all four digits are anatomically the same). Notice that **antebrachial deep fascia** (3) encloses and compartmentalizes antebrachial muscles. You will have to incise the fascia (arrow) to see the muscles (asterisk). A dew claw (pollex) (4) is present in this specimen.

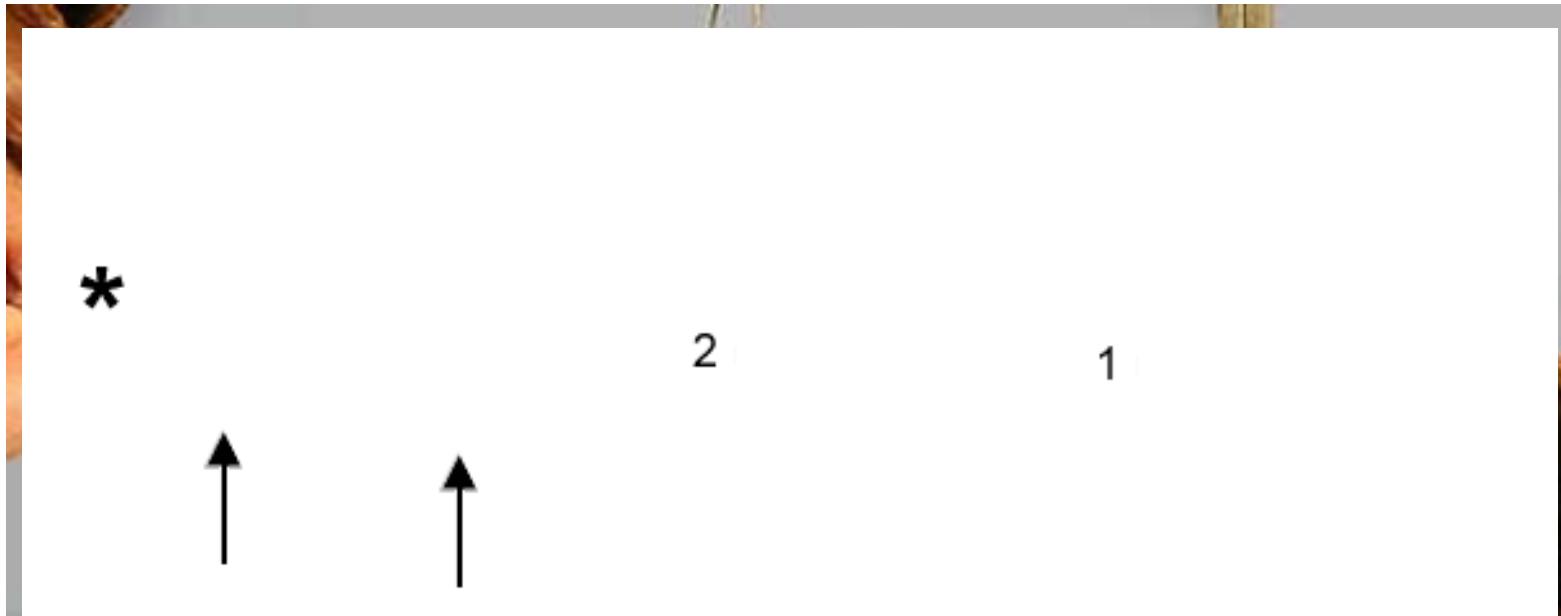

In general, the craniolateral group of antibrachial muscles acts to extend the carpus and extend the digits. Major muscles responsible for these actions are: **extensor carpi radialis m.** (1), **common digital extensor m.** (2), and **lateral digital extensor m.** (3). The **ulnaris lateralis m.** (4) functions to support (flex) the carpus. Two minor muscles are the brachioradialis m. (5) and the abductor pollicis longus m. (6).

Fascia has been removed except for the **extensor retinaculum** (7) that binds digital extensor tendons at the carpus. (Scissors elevate branches of the common digital extensor tendon.)

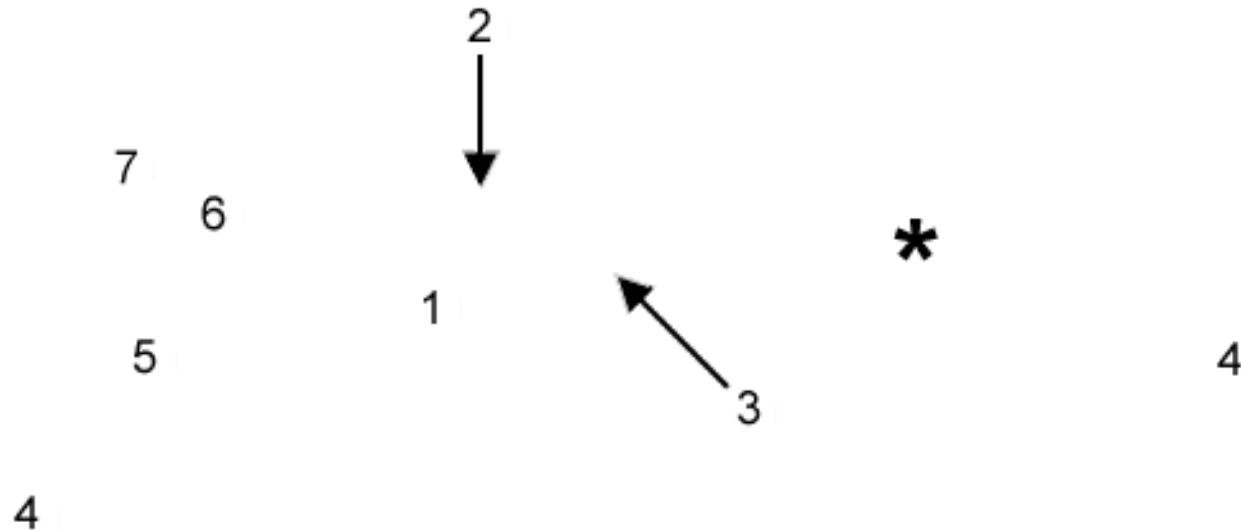

Tendons of the **common digital extensor m.** (1) and the **lateral digital extensor m.** (2) are elevated by forceps. Identify the **extensor carpi radialis m.** (3) and the **ulnaris lateralis m.** (4). The latter inserts on the accessory carpal bone. Craniolateral antebrachial muscles originate from the vicinity of the **lateral epicondyle of the humerus** (asterisk). Find the anconeus m. (5), caudal to the epicondyle.

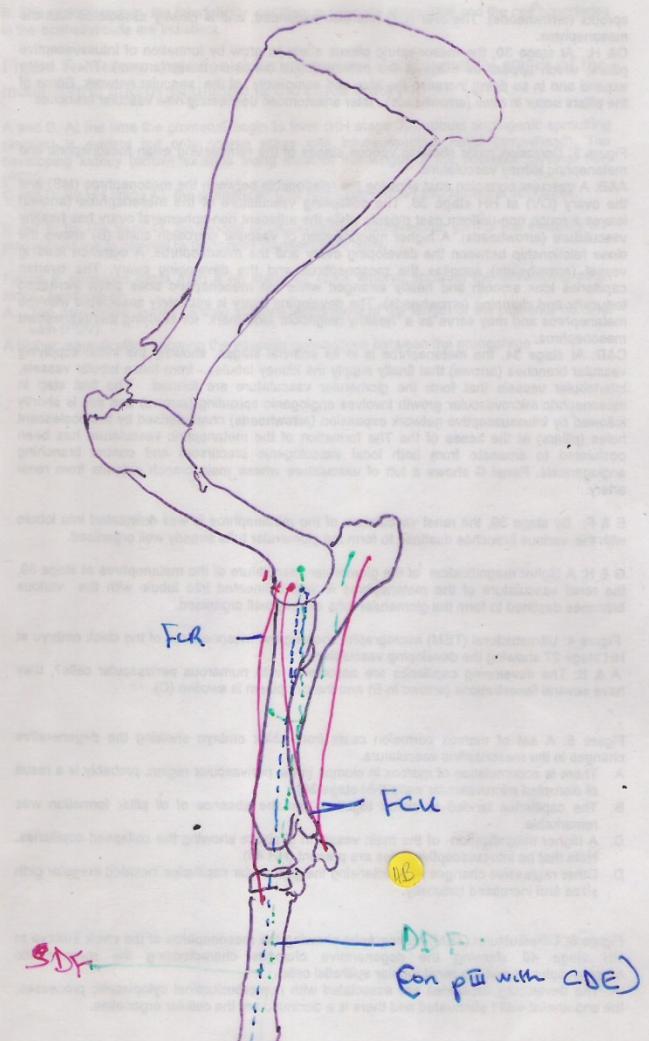

The caudal group of antebrachial muscles acts to flex (support) the carpus and digits. The muscles originate from the vicinity of the **medial epicondyle of the humerus** (asterisk). In this specimen, deep fascia has been removed from the antebrachium except for **flexor retinaculum** (1), which binds digital flexor tendons in the carpus. The **superficial digital flexor m.** (2) and its tendon branches are elevated by instruments. The flexor carpi ulnaris m. is indicated by arrows.

In this specimen, transected parts of the superficial digital flexor m. (1) have been reflected. The **flexor carpi ulnaris m.** (2) has humeral and ulnar heads. The latter is elevated by the forceps. The **flexor carpi radialis m.** (3) is positioned medially on the limb. The tendons of the deep digital flexor m. (4) are visible distal to the **flexor retinaculum** (5).

The humeral head (1) of the **deep digital flexor m.** is being pulled by forceps. The small radial head (2) attaches to the radius. The ulnar head (3) originates from the ulna. The deep layer of **flexor retinaculum** (asterisk) has been cut to release the tendon (arrow) of the deep digital flexor m. Other caudal-group muscles are: **superficial digital flexor m.** (4); **flexor carpi ulnaris m.** (5); **flexor carpi radialis m.** (6); and **pronator teres m.** (7).

MUSCLES OF THE HOCK AND DIGITS

I . MUSCLES THAT FLEX HOCK, EXTEND DIGITS- peroneal nerve

Muscle	Origin	Insertion	Action
1. Tibialis anterior m.	Lateral condyle of femur Tibial crest	Medially on tarsals metatarsus.	Flexes hock
2. Peroneus tertius (Fibularis tertius) (absent in carnivores)	Cranial muscular fossa of Femur	Distal tarsal bones, <i>proximal end of Metatarsus</i>	Flex hock
3. Long Digital Extensor m.	Cranial muscular fossa of femur	Dorsal surfaces of Phalanges (PI, PII, PIII)	Flexes hock Extends digit
4. Peroneus longus	Proximally on fibula	Distal tarsal bones	Flex hock?
5. Lateral digital extensor	LCL of stifle, Tibia, , fibula	Swine-PIII of D4 & D5 Ruminants-II of D4 Carnivores-PI of D5 Equidae-II of D3	-Flexes hock -Extends digit
6. Peroneus brevis (Occurs in carnivores only)	Fibula & tibia (laterally)	Proximal end of MT5	Flexes hock
7. Extensor hallucis longus	Fibula	Swine-PI of D2; occasionally on D1 or MT2	Extends digit

II. MUSCLES THAT EXTEND HOCK, FLEX DIGITS- Tibial nerve

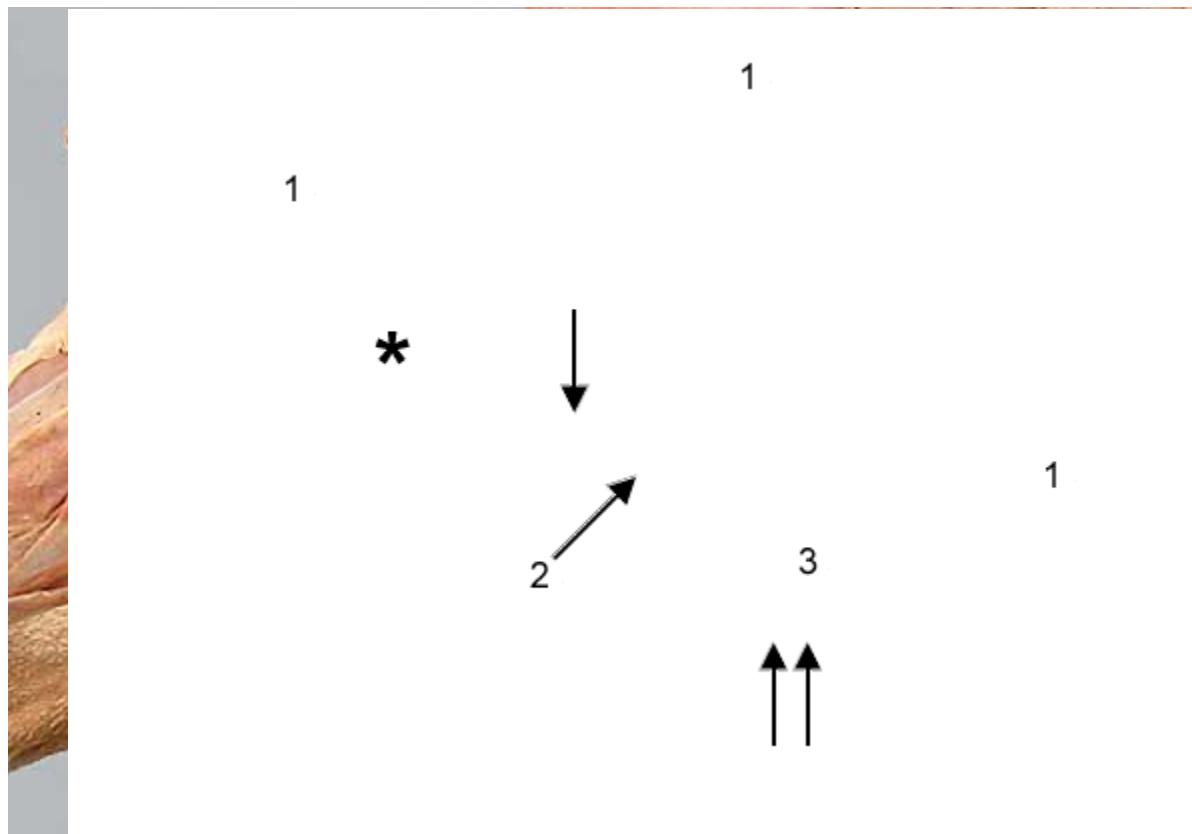

1. Gastrocnemius m.	Medial and Lateral Supracondyloid crest	Calcanean Tuber <i>(Common Calcanean Tendon, Achilles tendon)</i>	Flexes stifle Extends hock
2. Soleus m. (Prominent in swine)	Proximal Fibula	Joins Common Calcanean Tendon Of gastrocnemius	Could extend hock
3. Superficial digital flexor m.	Supracondylar fossa of Femur	Tuber calcis Swine + Ruminants-PI & PII of D3 & D4 Carnivores-PI & PII of D2-D5 Equidae-PI & PII of D3	Extend hock, flex digits
4. Deep digital flexor	a) Long digital flexor- lateral condyle of tibia b) Flexor hallucis longus m - lateral condyle of tibia c) Tibialis caudalis- posterior surface of Tibia	PIII on the palmer surface. Swine + Ruminants- D3 & D4 Carnivores- D2-D5 Equidae- D3	<i>Extend hock, flex digits</i>
5. Short muscles of the digits	Interosseous, flexors, extensors, abductors		

DISSECTED LEFT HIND LEG - DOG

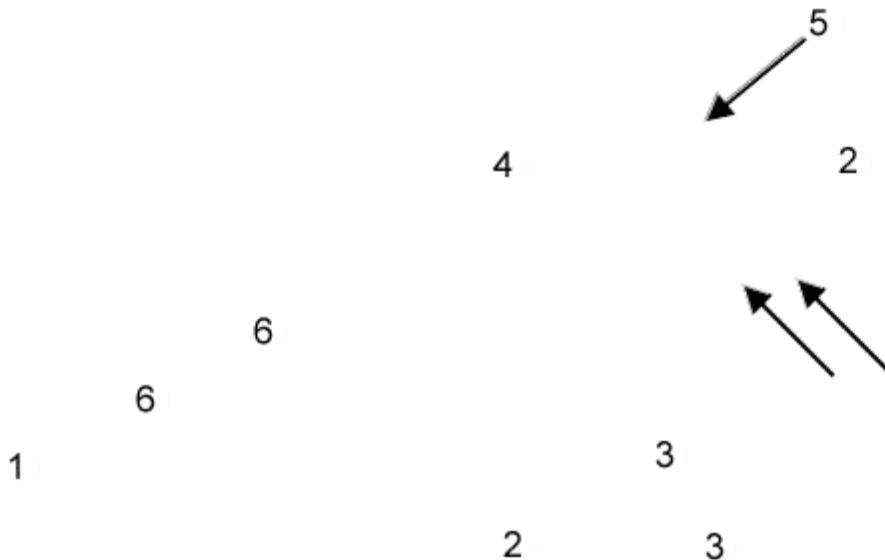

The largest of the hamstring (caudal thigh) muscles is the **biceps femoris m.** (1) which originates from the ischium and inserts broadly on **fascia lata** (2) and **crural fascia** (3). The muscle has been transected in two locations to facilitate reflecting it. The **semitendinosus m.** (4) is partially exposed. Other visible (non-hamstring) muscles include: **sartorius m.** (5), **tensor fasciae latae m.** (6), **middle gluteal m.** (7), **superficial gluteal m.** (8), **levator ani m.** (9), and **external anal sphincter m.** (10).

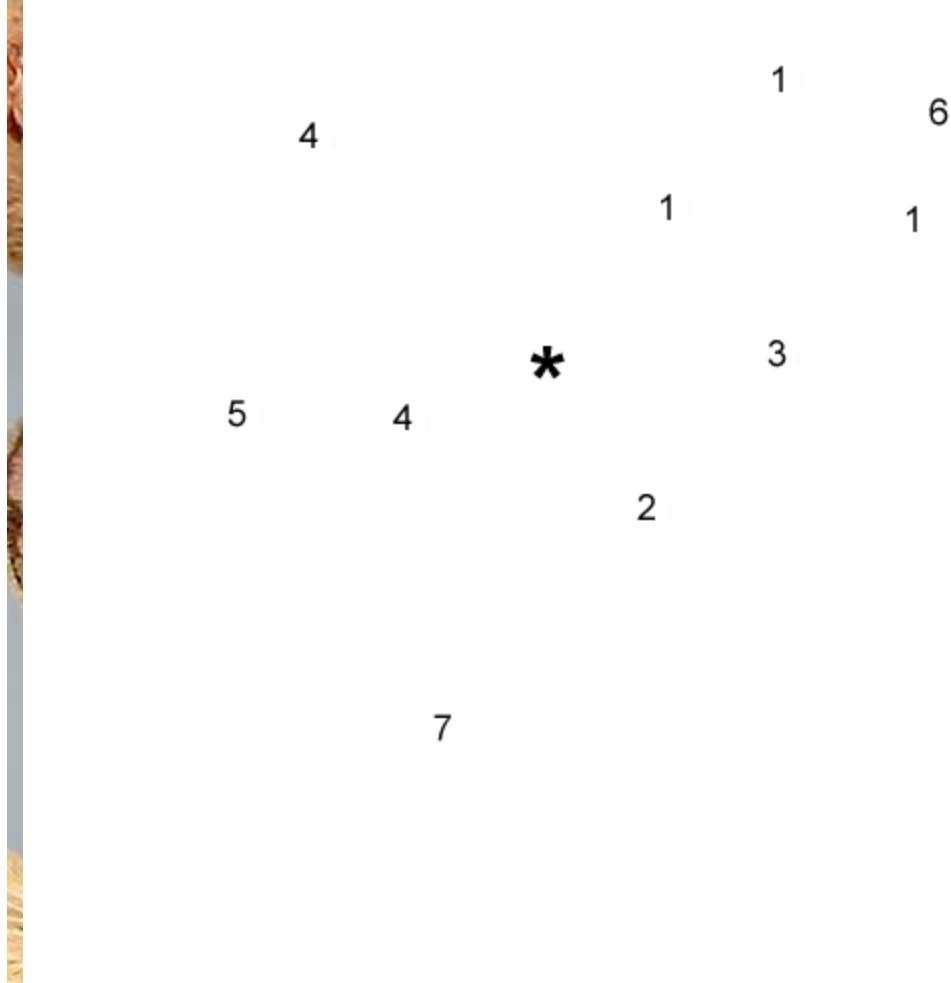

DISSECTED LEFT HIND LEG - DOG

Here the **biceps femoris m.** (1) has been reflected, exposing the **sciatic nerve** (arrow) and the slender **caudal crural abductor m.** (2). The remaining major hamstring muscles are: **semitendinosus m.** (3) and, barely visible, the **semimembranosus m.** (double arrows). Caudal muscles of the crus are exposed (asterisk)

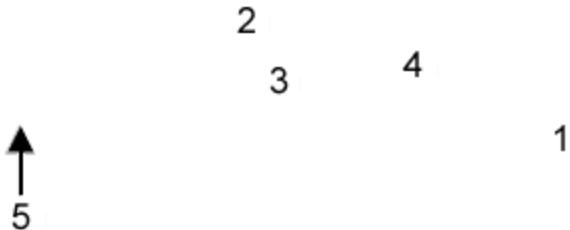

In this view of the medial thigh, the **gracilis m.** (1) has been reflected caudally and the **pectineus m.** (2) has been transected. Femoral vessels (arrows) run caudal to the **sartorius m.** (3). The **adductor m.** (4) has a slender second component called **adductor longus m.**, which is barely visible (5). Reflection of the gracilis m. reveals the two parts of the **semimembranosus m.** (6), which belongs to the hamstring muscle group

Dorsal view of the rump, the tail is at the bottom of the image. The lateral pelvic muscle group is cranial and dorsal to the **greater trochanter** (asterisk). The **tensor fasciae latae m.** (1) has cranial and caudal parts. The **superficial gluteal m.** (2), is elevated by probe. It partially covers the **middle gluteal m.** (3). Other identifiable muscles include: **biceps femoris** (4), **semitendinosus** (5), **sartorius** (6), and the external anal sphincter (7).

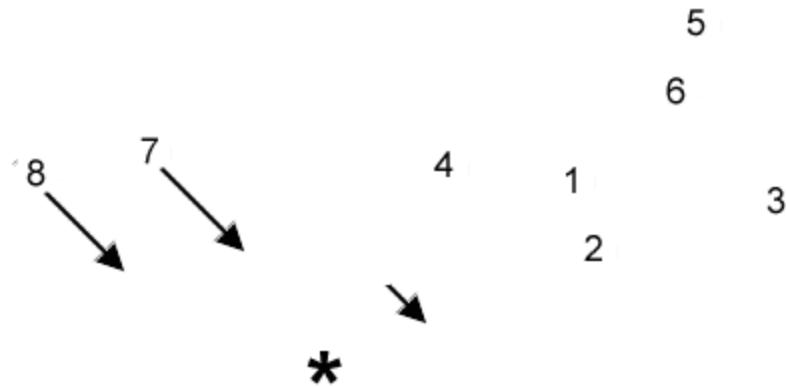

DISSECTED LOWER LEFT HIND LEG - DOG

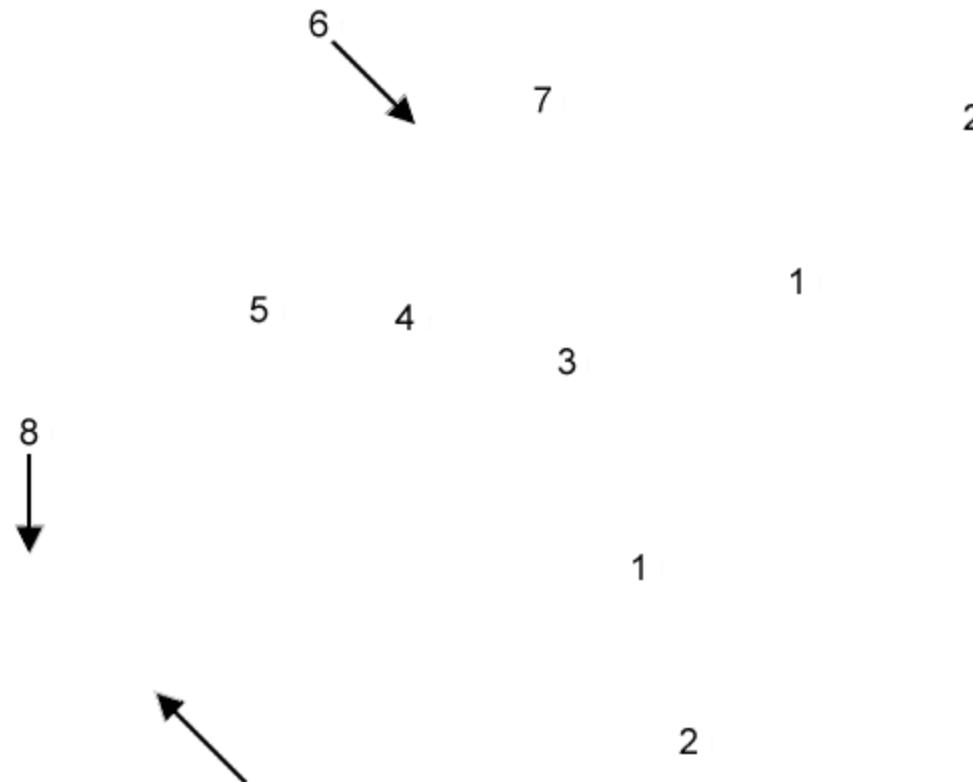

Crural deep fascia (to which **biceps femoris m.** (1) attaches) has been reflected (and held by forceps) in this lateral view of the crus. Three muscles of the *caudal group* can be seen: **deep digital flexor m.** (2), **superficial digital flexor m.** (3), and **gastrocnemius m.** (4).

The **calcanean tendon** (5) is composed of a core component formed by tendons of the **superficial digital flexor** and **gastrocnemius** muscles. The tendon also has deep fascia components contributed by **biceps femoris**, **semitendinosus**, and **gracilis** muscles. (In the cat, a **soleus m.** contributes to the tendon core.)

DISSECTED LOWER LEFT HIND LEG - DOG

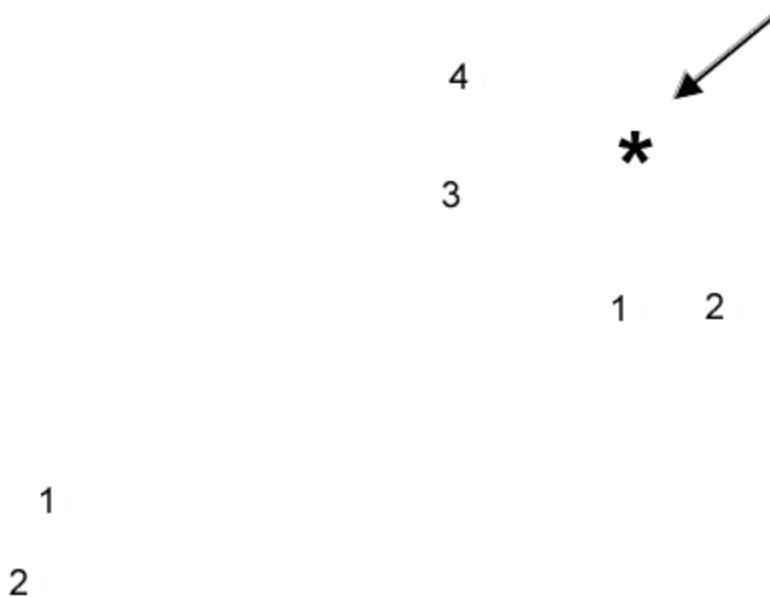

Lateral view of the crus (leg) and pes (foot). The caudal group of muscles of the crus includes: **deep digital flexor m.** (1), **superficial digital flexor m.** (2), and **gastrocnemius m.** (3). The tendon of the gastrocnemius m. (reflected by forceps) and the tendon of the superficial digital flexor m. (arrow) form the core of the calcanean tendon (asterisk). Also notice: the **long digital extensor m.** (4), the **cranial tibial m.** (5), the **peroneus longus m.** (6), and the **crural extensor retinaculum (7)** and **tarsal extensor retinaculum (8).**

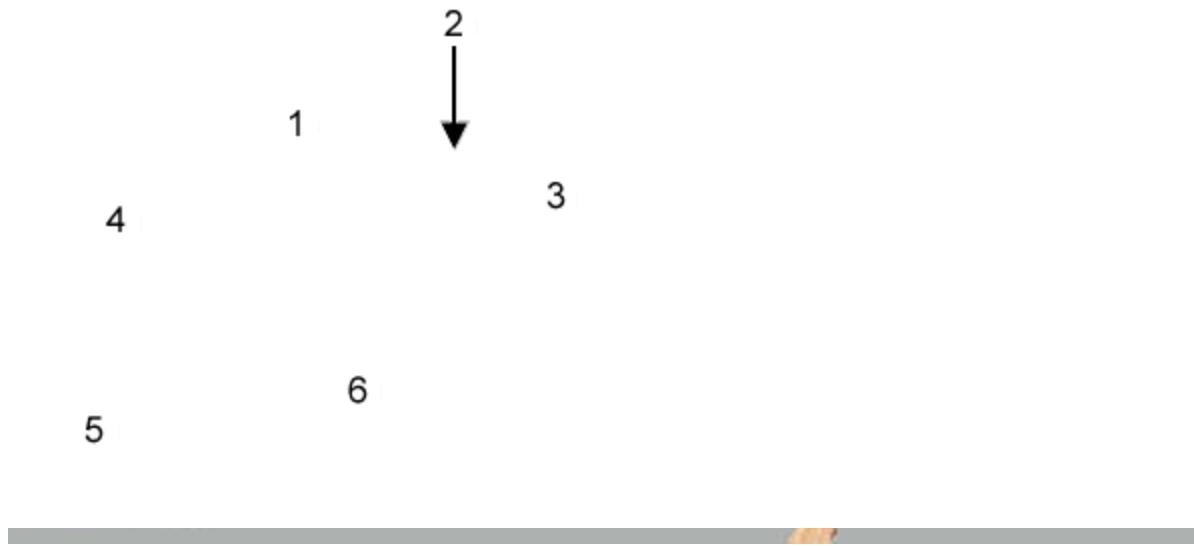

Here, the medial (1) and lateral (2) heads of the **gastrocnemius m.** have been transected and reflected. The **superficial digital flexor m.** (3) and the **deep digital flexor m.** (4) can be seen. Notice that the tendon of the gastrocnemius m. rolls laterally as it moves from a superficial to a deep position in the calcanean tendon (arrow). The position switch is necessary because the superficial digital flexor tendon continues distally to reach the digits.

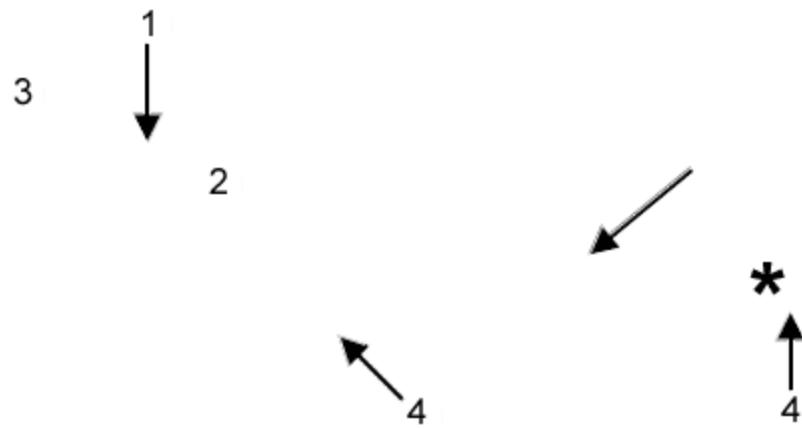

Also notice: the long digital extensor m. (5), the cranial tibial m. (6), the peroneus longus m. (7), and the crural extensor retinaculum (8).

In this caudal view, medial (1) and lateral (2) heads of the **gastrocnemius m.** have been transected and reflected. The **superficial digital flexor m.** (3), the **deep digital flexor m.** (4), and the tendon (arrow) of the **popliteus m.** (asterisk) can be seen.

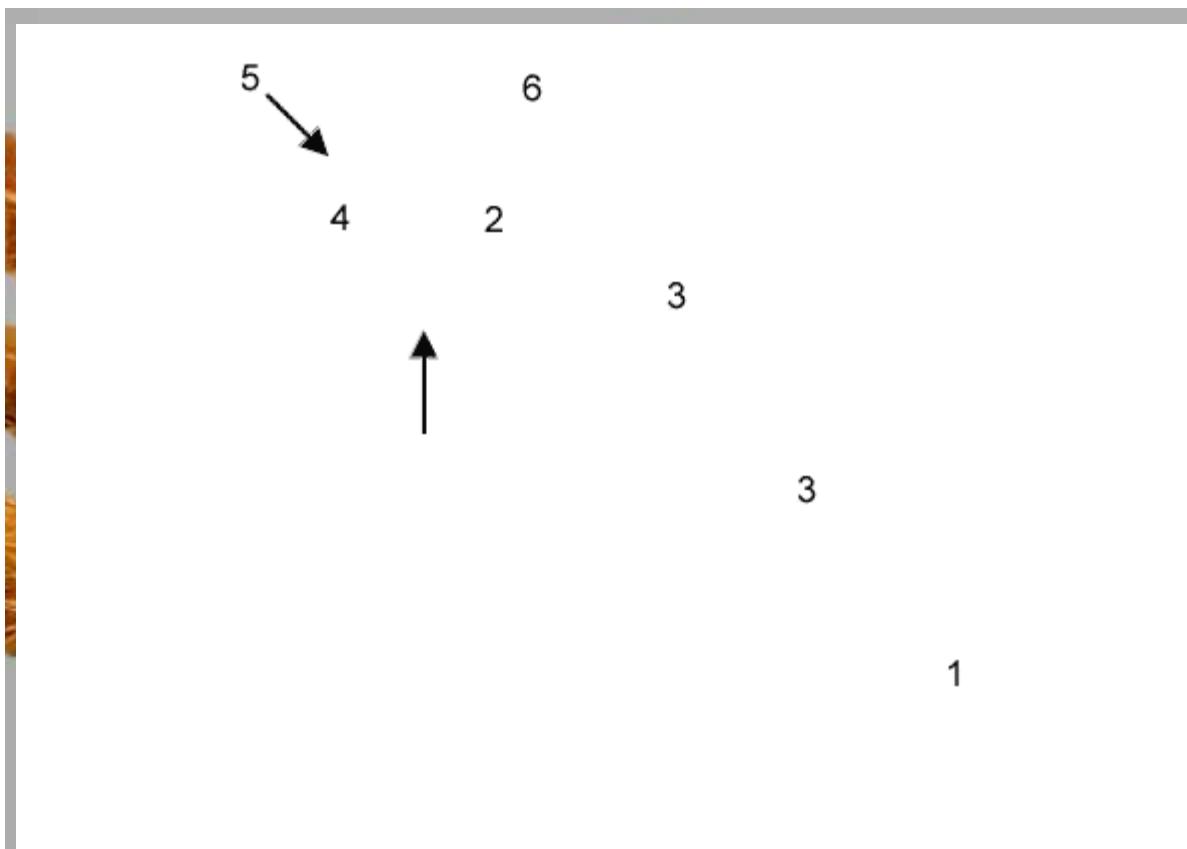

In this medial view, the **popliteus m.** (1) is exposed. The **deep digital flexor m.** is composed of a small medial head (2) and a large lateral head (3). The medial head (4) of the **gastrocnemius m.** is attached but the lateral head (5) and the **superficial digital flexor m.** (6) are pulled caudally

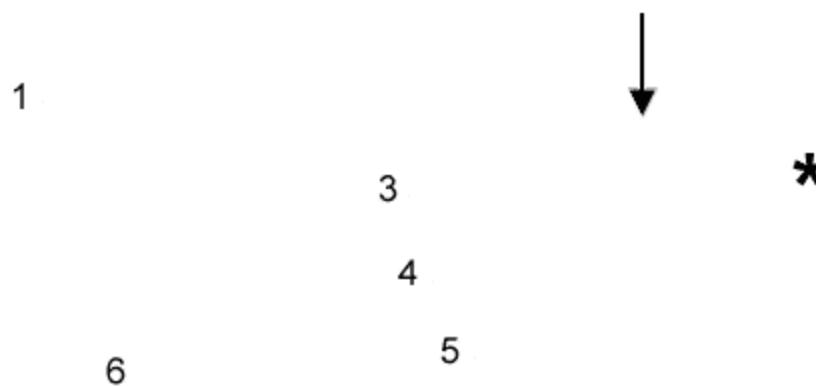

The tendon of the medial head (1) of the **deep digital flexor m.** is elevated by forceps. Notice that it joins the tendon of the **lateral head** (2) in the metatarsus (asterisk). Both tendons are bound to the tarsus by flexor retinaculum (arrow) which has been cut. Identify the **popliteus m.** (3) and the tendon of the **superficial digital flexor m.** (4).

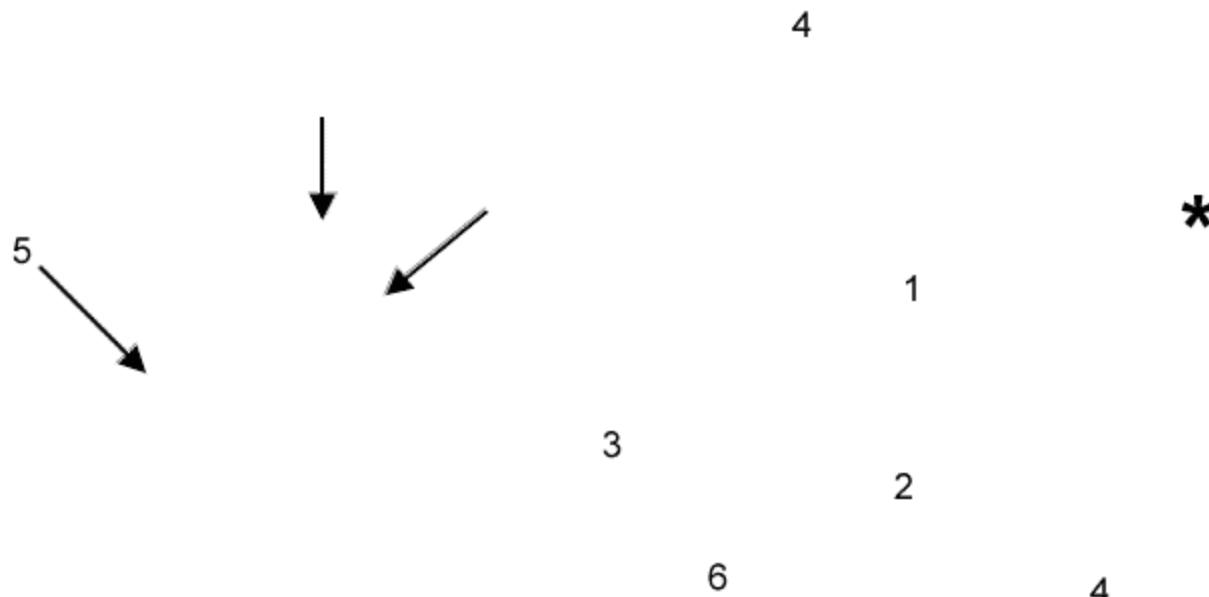

DISSECTED LOWER LEFT HIND LEG - DOG

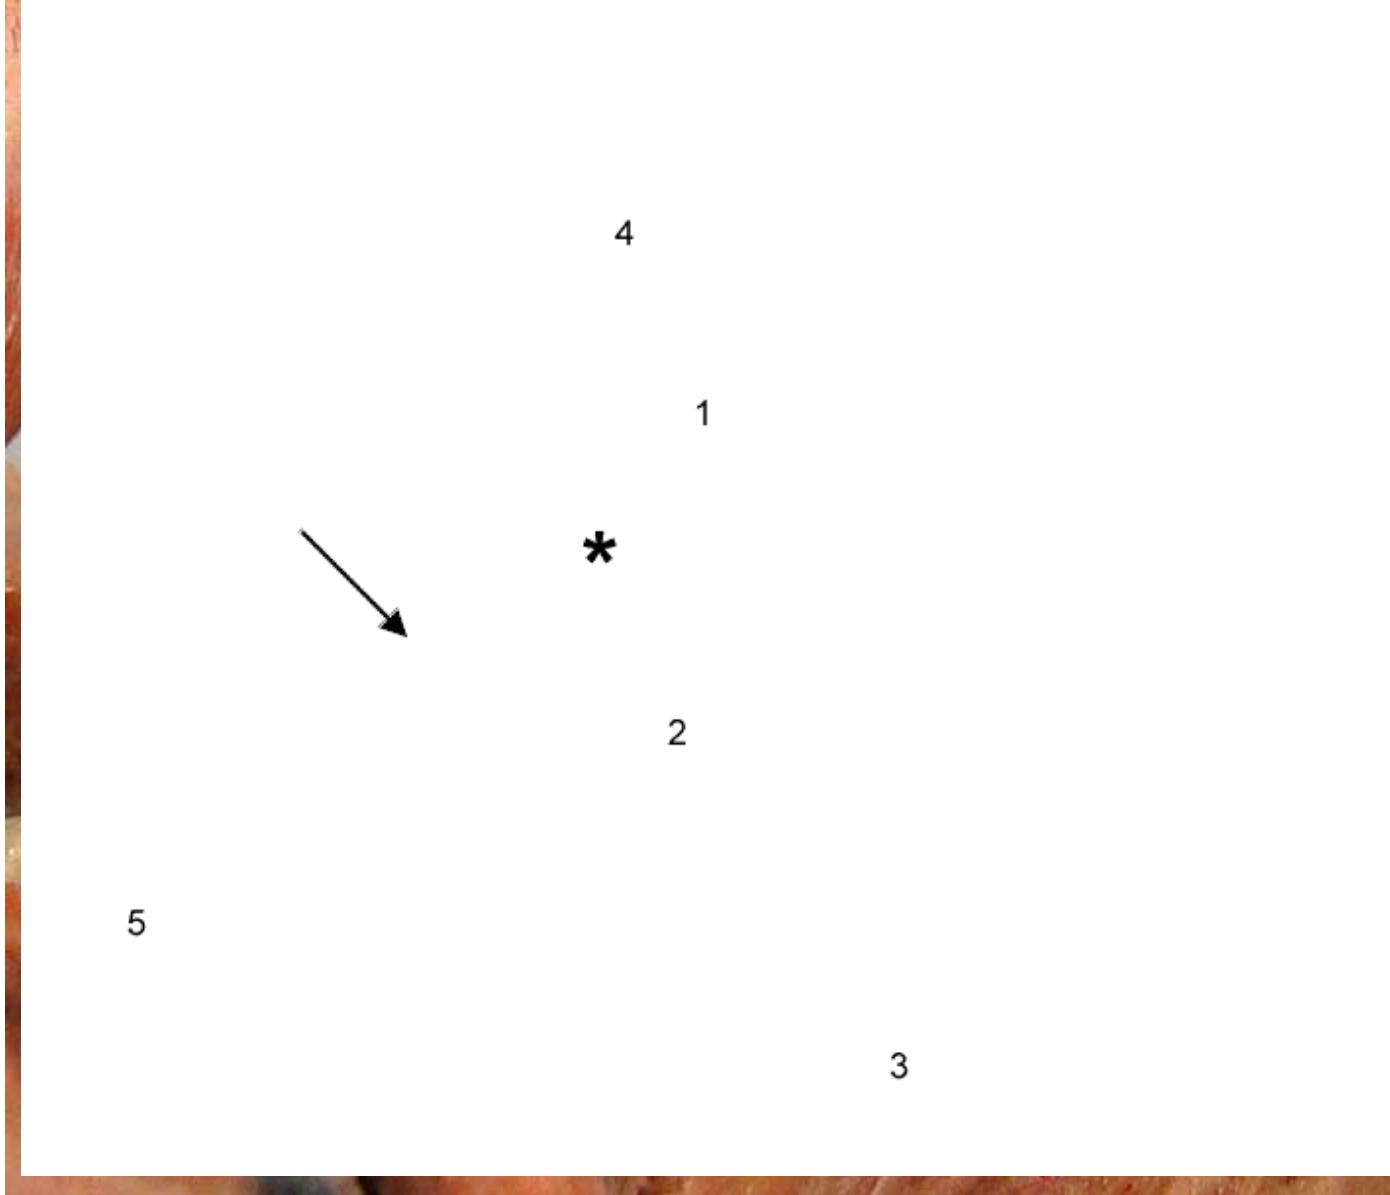

This lateral view of a cat pelvic limb shows two muscles that are present in the cat but not in the dog. The **caudofemoralis m.** (1) runs from fascia lata to tail vertebrae. The **soleus m.** (2), which joins the calcanean tendon, is positioned lateral to the gasctocnemius m. (arrow). Other muscles include: **biceps femoris** (3), **deep digital flexor** (4), long digital extensor (5), and cranial tibial (6).

Muscles of the crus, cat. In the bottom image, the **gastrocnemius m.** (1) is reflected to expose the **superficial digital flexor m.** (2) and the **soleus m.** (3). Tendons of these three muscles form the core of the **common calcanean tendon** (arrow). The asterisk is over the tuber of the calcaneus bone (tuber calcanei). The **deep digital flexor m.** (4) runs along the tibia. Cranial muscles of the crus include the long digital extensor m. (5) and the cranial tibial m. (6).

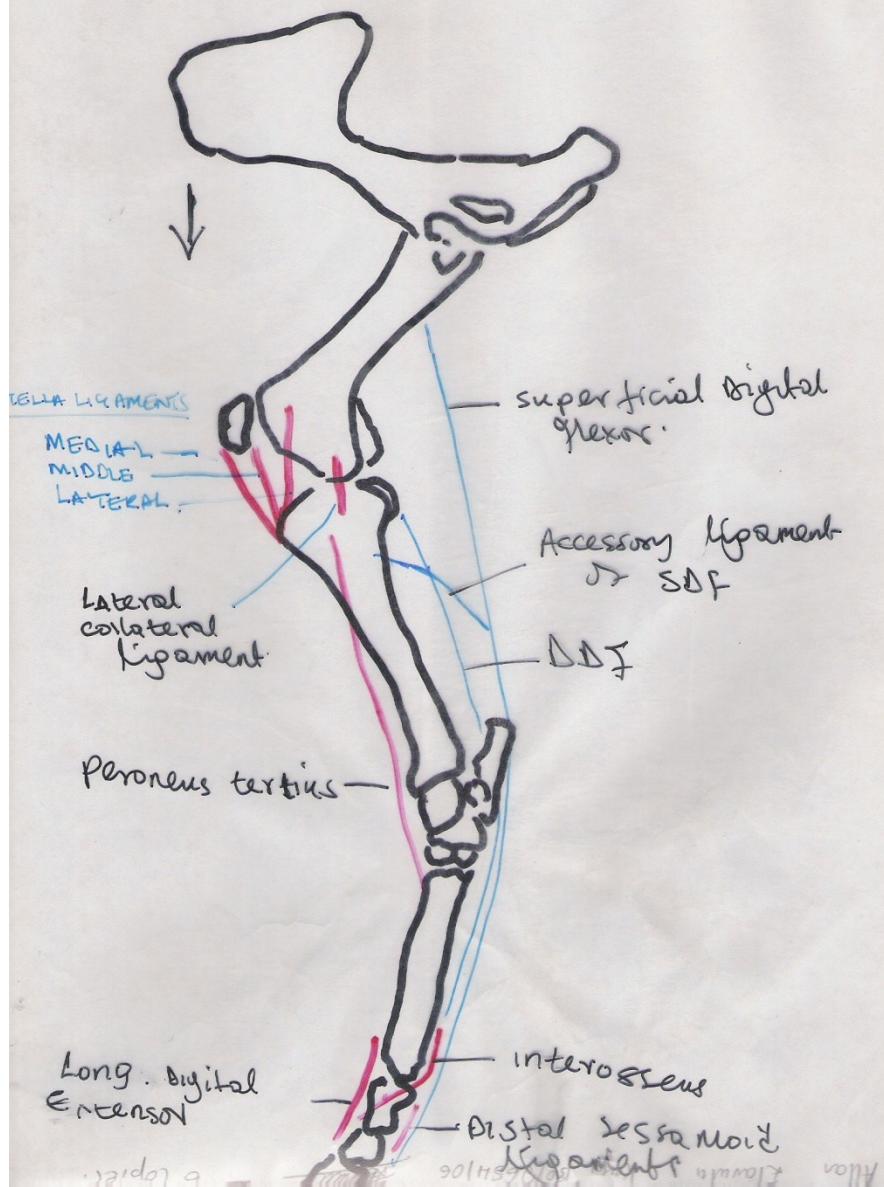

Crus of the cat, caudal muscles are dissected. The medial head (1) of the **gastrocnemius m.** is reflected to expose the lateral head (2) and the **soleus m.** (3). Notice that the fabella bone (asterisk) at the origin of the medial head is also reflected. The **superficial digital flexor m.** (4) is transected and reflected, exposing the calcaneal bursa (arrows) and lumbricales mm. (5). The **deep digital flexor m.** (6) is on the tibia

The joint capsule (1) is incised to expose the cavity of the coxofemoral joint of the cat. Notice the **ligament of the femoral head** (2), the **head of the femur** (asterisk), and the acetabular lip (arrow), which rims the acetabulum. Also identify the obturator foramen (3), articularis coxae m. (4), and femoral vessels (5).

PASSIVE STAY APPARATUS

COR-RESISTANT

The Passive Stay Apparatus

Horses remain on their feet for long periods, much longer than other animals. Most of the weight when a horse is at rest is carried by the tendons ligaments and deep fascia of each leg. This means that when standing, the horse requires minimal muscle activity and does not tire quickly. The supportive mechanisms in both the fore and hind limbs are both very similar in the horse.

How does the stay apparatus function?

The stay apparatus transfers weight from the limb muscles to connective tissue structures that do not tire, namely **tendons, ligaments or bone**. With the weight shifted from muscle to connective tissue elements or bone, the horse requires less muscular activity to keep the limb stable and hold up the front end of the body.

The stay apparatus helps the limb resist gravitational forces that would otherwise cause the thoracic limb joints to flex and allow the body to collapse to the ground.
